From Opaque Spend to Financial Clarity

Mastering Cost Management & Consumption Billing in Tanzu Hub

An Executive Guide to IT Chargebacks and Platform Optimization

NotebookLM

The Old Way: Opaque Infrastructure Spend

IT budgets are viewed as monolithic overhead. It is nearly impossible to align platform spend with actual business unit usage, leading to inefficient forecasting and disputed chargebacks.

The Tanzu Way: Consumption-Based Cost Views

Move from abstract aggregate spend to precise, granular visibility. Set internal prices that perfectly match the cost of running workloads, enabling consistent billing and showback models across the enterprise.

NotebookLM

The Valuation Equation: How Tanzu Hub Computes Cost

Metering Metrics

Continuous, precise capture of platform consumption over time (e.g., instance-hours, memory GB-hours).

Rate Cards

Configurable hourly rates in your chosen reporting currency (USD, EUR, AUD, INR) assigned to specific resources.

Computed Cost

The exact financial amount attributed to resource use, rolled up seamlessly across your entire Cloud Foundry hierarchy.

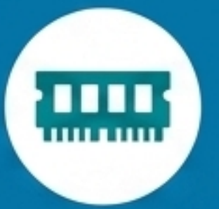

NotebookLM

The Currency of Consumption: What Are We Measuring?

App Instance Hours

The cumulative time that primary application instances are actively running.

App Memory GB-Hours

The total gigabyte-hours of memory consumed by application instances over the measured period.

Task Instance & Memory Hours

The distinct time and memory consumed by task instances running under an application.

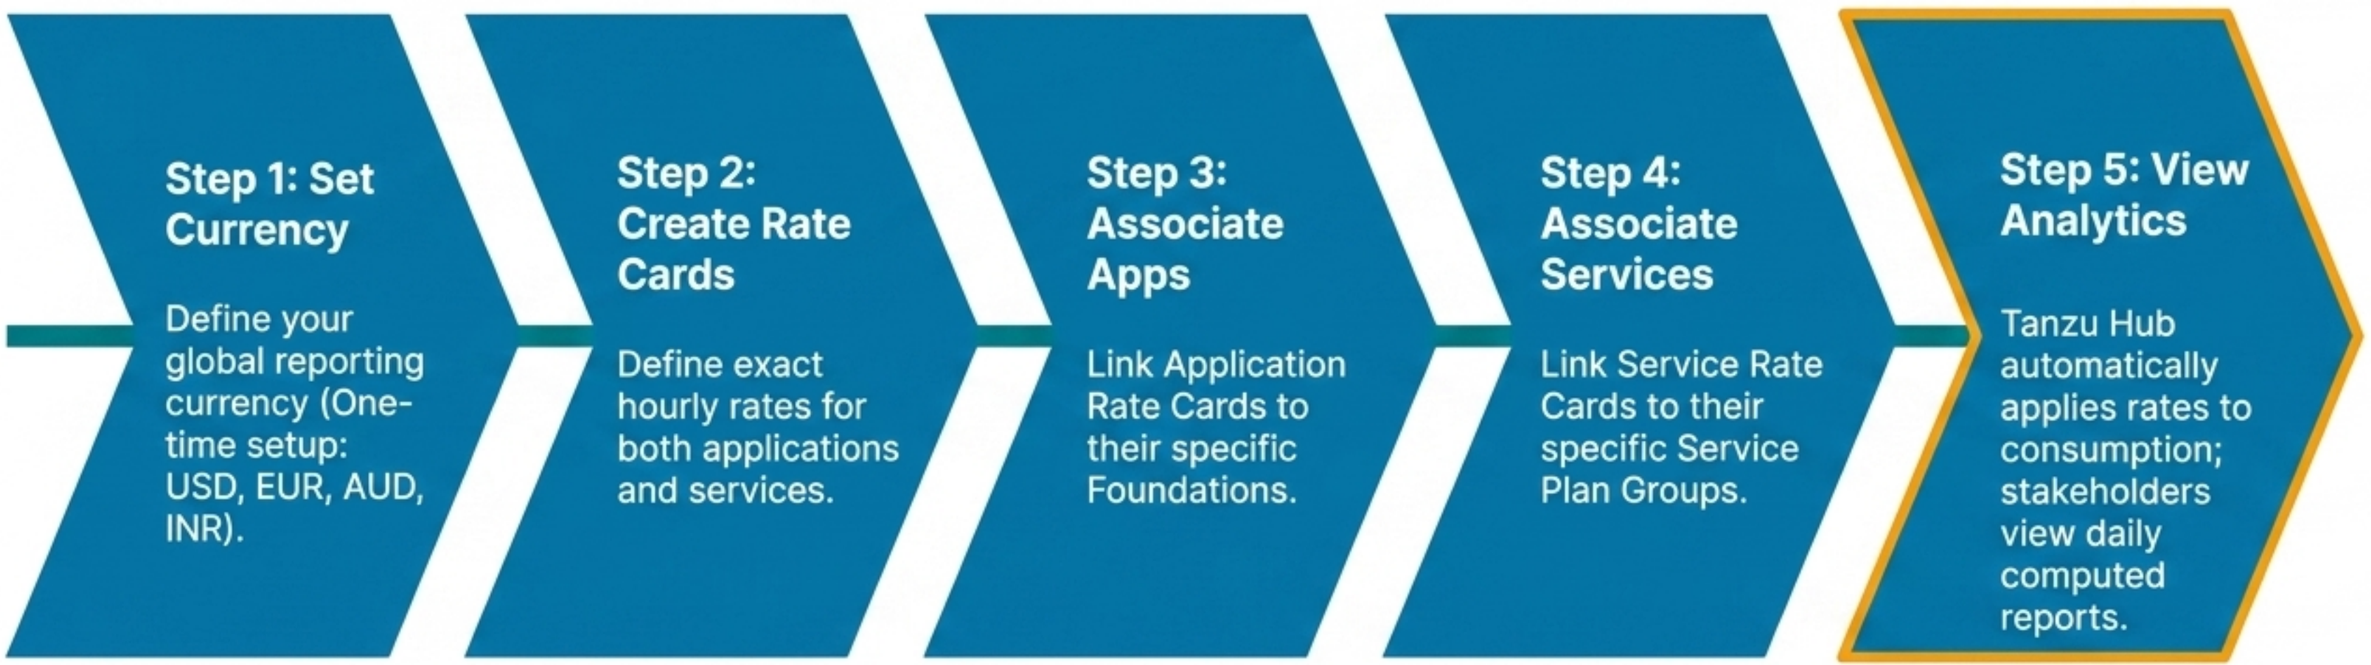

Service Instance Hours

The cumulative time that service instances (backed by a specific service plan) run.

A Centralized Workflow for Enterprise Pricing

NotebookLM

Dynamic Pricing Mechanisms: App vs. Service Rate Cards

Application Rate Cards	Service Rate Cards
What it Prices: App/Task Instances & Memory GB-Hours.	**What it Prices:** Service Instance hours.
Associates With: Foundations.	**Associates With:** Service Plan Groups.
Key Use Case: Differentiating costs based on underlying hardware profiles or environments (e.g., higher rates for Prod hardware vs. Dev hardware).	**Key Use Case:** Charging premium rates for value-added capabilities (e.g., High Availability, automated backups) versus basic tiers.

NotebookLM

Why One Price Doesn’t Fit All: The Business Logic of Multiple Rate Cards

Scenario A: Tiered Offerings

Map internal service tiers to distinct rates. Charge more for “Gold” service plan groups featuring High Availability, while offering “Basic” plans at cost.

Scenario B: Hardware Hardware & Capacity

Not all foundations cost the same to run. Charge higher internal rates for workloads consuming premium hardware or operating in high-cost regional data centers.

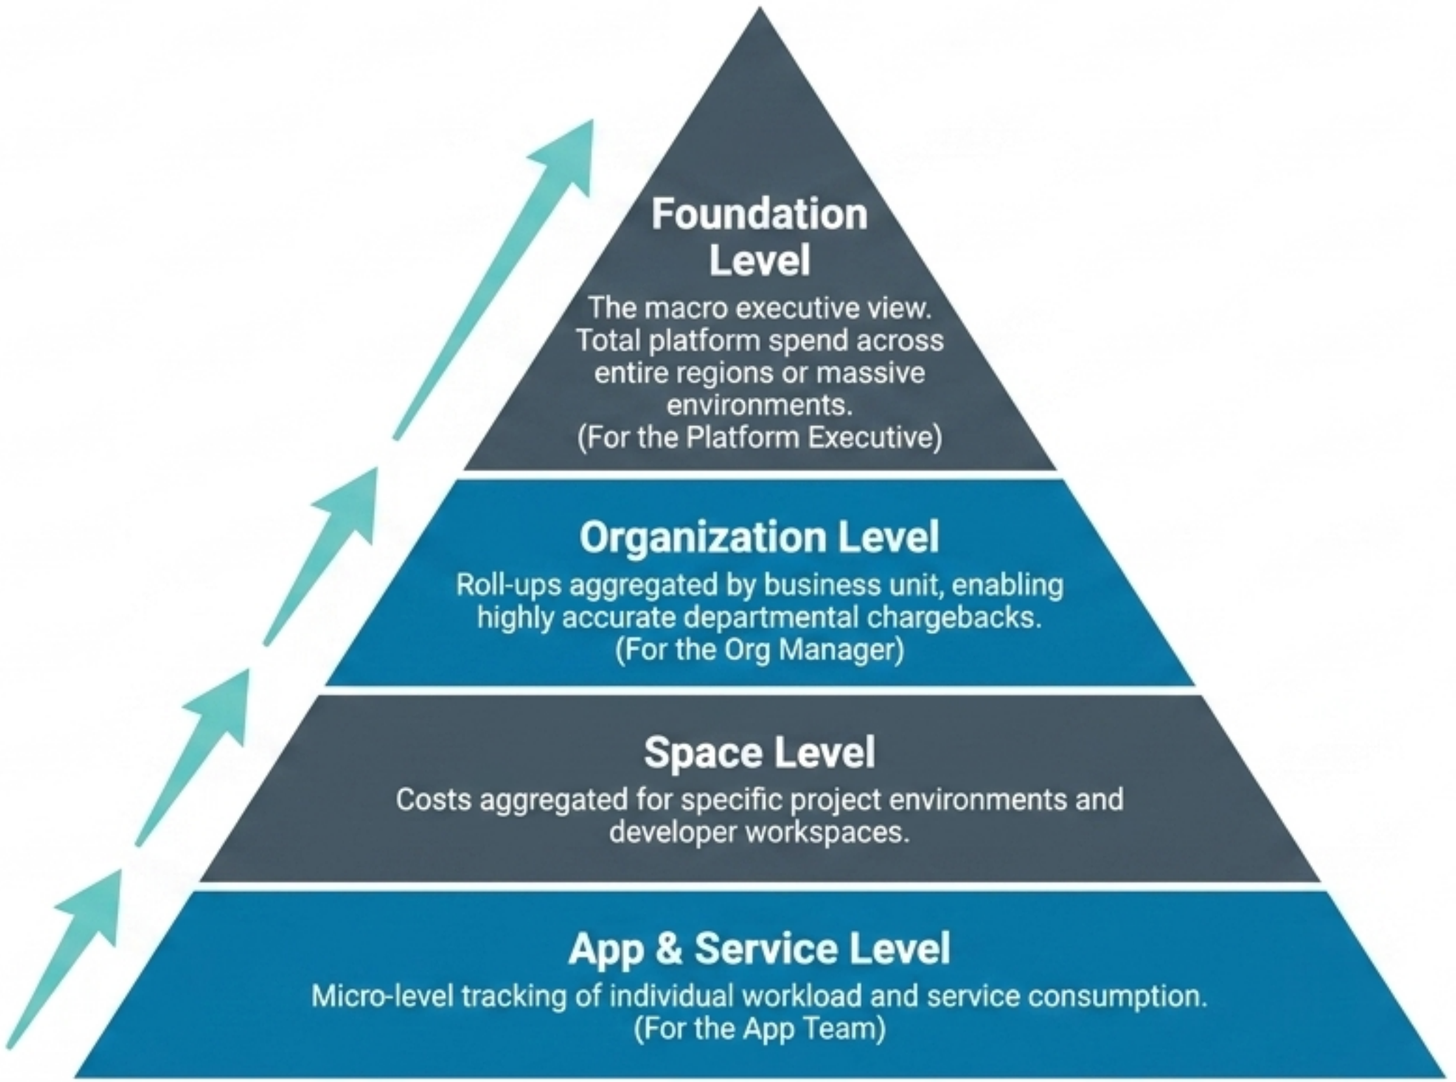

Scenario C: Lifecycle Environments

Shape developer behavior by enforcing stricter, higher ratts rates for Production environments while subsidiz-zing Development and Staging spaces to encourage risk-free innovation.

Full-Stack Financial Visibility: The Roll-Up

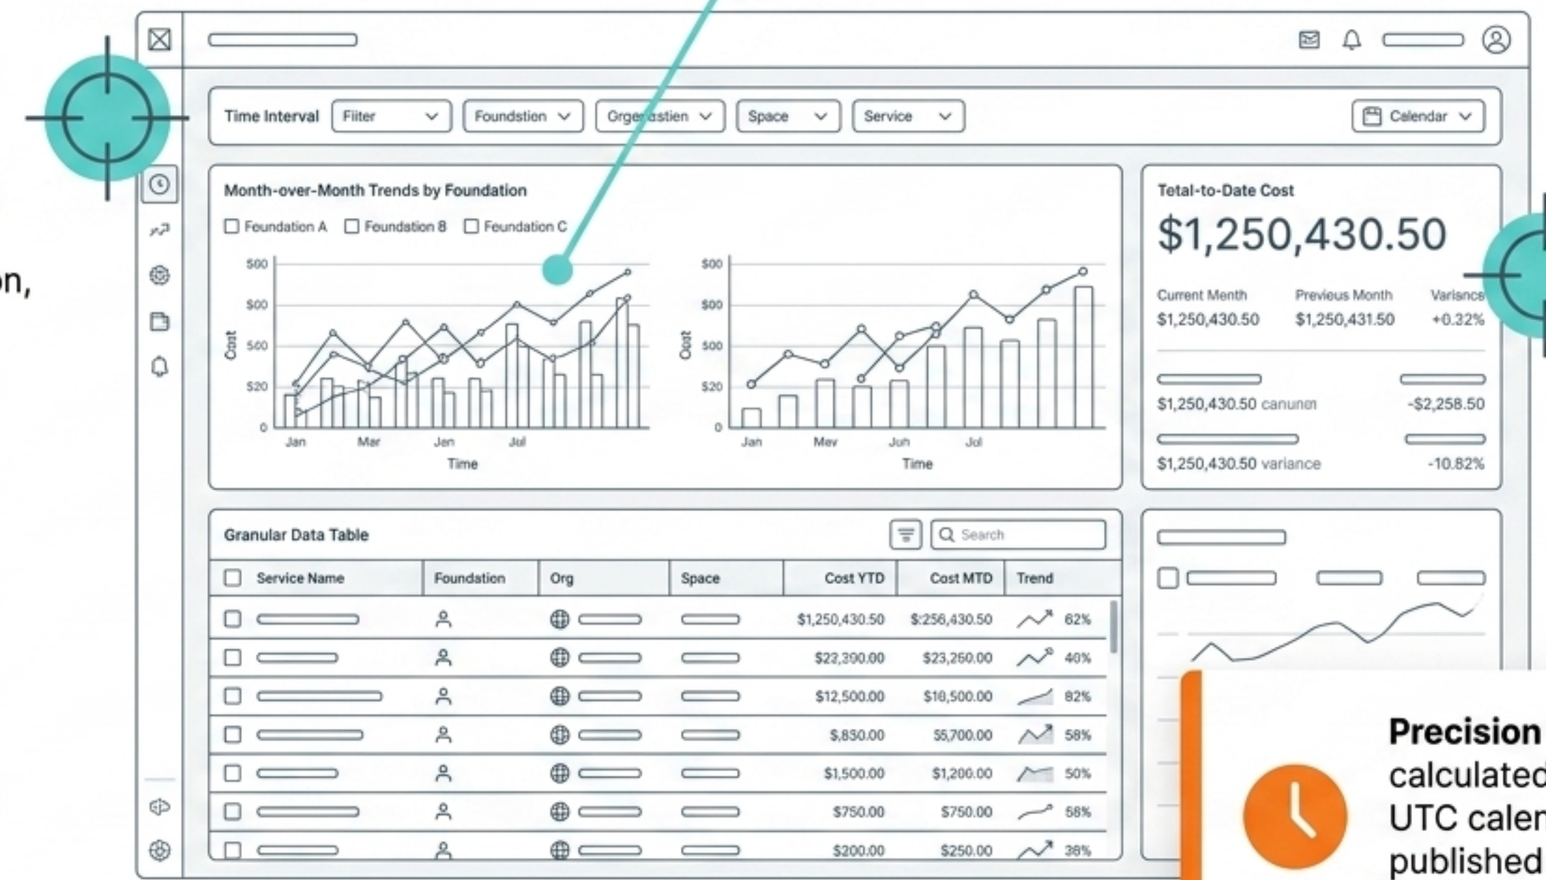

NotebookLM

Your Central Financial Command Center

Month-over-Month Trends:
Track historical cost trajectories over time, broken down visually by foundation.

Granular Filtering:
Instantly slice financial data by time interval, foundation, organization, and space.

Total-to-Date:
Monitor cumulative costs for the currently selected time periods.

Precision Timing: Daily cost is calculated using precise midnight UTC calendar day boundaries and is published the following day, ensuring absolute ledger accuracy.

Consume Financial Data Your Way

Built-in Overview

The native UI Cost Overview dashboard provides immediate, out-of-the-box reporting with zero configuration required.

Custom Dashboards

Add the “Cost Widget” to custom observability dashboards.

Monitor financial spend directly alongside technical performance metrics like CPU and Memory in a single pane of glass.

GraphQL API

Query cost data programmatically.

Automate reporting, integrate directly with enterprise ERPs, or feed data into custom BI tools.

NotebookLM

Secure Financial Governance (RBAC)

Role	Scope	Capabilities
Global Administrator	Fleet-wide	Full control. Can configure currency, create rate cards, manage all associations, and view cost data across all foundations.
Global Viewer	Fleet-wide	Executive oversight. Can view cost data across all foundations but cannot alter rates or settings.
CF Foundation Administrator	Localized	Focused visibility. Can view cost data exclusively for their assigned foundations.

NotebookLM

Driving Business Outcomes with Cost Management

Enable Chargebacks

Implement accurate, consistent internal billing (showback/chargeback) based on undeniable, metered consumption.

Justify Renewals & Expansion

Use hard historical data to prove platform ROI and build bulletproof business cases for new capacity.

Optimize Utilization

Identify over-provisioned or under-utilized spaces to proactively reclaim resources and eliminate waste.

Shape Developer Behavior

Use tiered internal pricing to naturally guide engineering teams toward the most cost-effective architectures and environments.

NotebookLM

Aligning IT Spend with Business Value

Total transparency from the macro foundation level down to the individual application instance.

Flexible, dynamic pricing engines that adapt entirely to your internal business logic and SLAs.

Actionable financial data that transforms IT from an opaque cost center into a strategic, measurable partner.
